Design and Nature

Objectives

Our understanding of the modern world is largely based on an ever increasing volume of scientific knowledge. Engineering designers have at their disposal a vast array of relationships for materials, mechanisms and control, and these laws have been painstakingly assembled by the observation of nature. As space activity accustoms us to cosmic scales, and as medicine and biology to the molecular scale of genetics, we have also become more aware of the rich diversity of the structural world around us.

The parallels between human design and nature has inspired many geniuses through history, in engineering, mathematics and other subjects. Much more recently there has been significant research related to design and invention. Even so, current developments in design engineering, and the huge increase in biological knowledge, together with the virtual revolution in computer power and numerical modelling, have all made possible more comprehensive studies of nature. It is these developments which have led to the establishment of this international book series.

Its rationale rests upon the universality of scientific laws in both nature and human design, and on their common material basis. Our organic and inorganic worlds have common energy requirements, which are of great theoretical significance in interpreting our environment.

Individual books in the series cover topics in depth such as mathematics in nature, evolution, natural selection, vision and acoustic systems, robotics, shape in nature, biomimetics, creativity and others. While being rigorous in their approach, the books are structured to appeal to specialist and non-specialist alike.

Dedication

**Professor Wolfgang Liebe
(1911-2005)**

This book is dedicated to the memory of Prof Wolfgang Liebe, father of the Editor, Roland Liebe, and an outstanding scientist, who recently passed away.

It is difficult to summarise in just a few paragraphs the long and very successful career of Professor Wolfgang Liebe, who worked on fluid dynamics for 65 years. He ended up as Professor Emeritus at the Technical University of Berlin, having started as a Research Engineer at DVL Berlin before the War. He acted as a Consultant to the Yugoslavian Aircraft industry and was Manager of Siemens in Berlin.

Before graduating from the Technical University of Danzig in 1936, he worked as a trainee at the Junkers Aircraft Company helping to produce the legendary aeroplane. He obtained his Doctorate from the University of Hannover in 1953, before becoming Professor at the Technical University of Berlin in 1957.

Among his many honours, he designed the best glider plane (The ORAO) for the Yugoslavian aircraft industry, and developed the technique known as “boundary layer fence” to improve flight safety preventing stall.

Professor Liebe was the author of numerous scientific papers and had several patents to his credit.

His research concentrated on aircraft engineering, focusing on Vortex dynamic (he is credited with the development of the finite vortex method) but he also worked on thrust and lift generation in nature, particularly applied to bird flight and fish propulsion.

Professor Liebe had many interests outside engineering, such as music, enjoying nature and sailing.

In 2004, on the occasion of the 2nd International Conference on Design and Nature, Professor Wolfgang Liebe was awarded the Eminent Scientist Medal by the Wessex Institute of Technology, an award given annually to outstanding scientists who are also people of integrity. On this occasion, Professor Liebe referred to his early interest in finding out how a plane could fly, which led to him studying aeronautical engineering. He said that it took him 65 years of patience and research to be able to answer that question to his entire satisfaction.

Preface

The text of “Flow Phenomena in Nature“ is easy to understand, and mathematical details as well as specialized terminology are avoided. The authors contribute in a unique manner to a transdisciplinary exchange of their latest findings. This approach eliminates the barriers of thought between different research communities.

This book presents the latest results from fluid dynamics, which are applied to swimming and flying in nature as well as to human engineering, medicine and other fields. The topics range from up-to-date research to innovative product design. Most of the findings are published here for the first time.

The respected authors come from very different fields: biology, mathematics, medicine, engineering, zoology, physics etc. They represent well-known international research institutions and companies in England, Germany, the USA, Sweden, Holland and Japan.

This book is written for experienced researchers, lecturers and postgraduates from any background. Further target readers are non-specialists and students who are keen to understand nature and evolution. Developers of new products in engineering, medicine or other fields of application will also be interested in the practical side as well as for research and development proposals for the future.

Roland J. Liebe
Monheim a. Rh., Germany, 2006

Acknowledgements

The initiative for this work came in 2003 from Professor Carlos Brebbia, Director of the Wessex Institute of Technology (WIT) in England. I would like to thank him for initiating and supporting this book project as part of his successful “Design and Nature” series.

I am grateful for the contributions, the inspiring discussions and stimulations from my father Wolfgang Liebe in Berlin. He worked on two papers for this book until August 2005. Unfortunately he was unable to finish his contribution.

I would also like to thank Axel Liebe-Picard for his striking creative designs for the book covers, which represent the contents extremely well.

I am indebted to all authors for their excellent contributions. In particular I wish to thank the following authors for their stimulating discussions and engagement, which mutually generated new ideas during the review process: Frank Fish, Peter Freymuth and Max Platzer from the USA; Volker Simon and Bernhard Weigand from Germany; Anders Hedenström from Sweden and Keiji Kawachi from Japan.

Many thanks also go to the key people from WIT Press in the UK for their support: Brian Privett, Keith Godwin, Claire Ransom and Layla Sowinski from the Production and Marketing Departments of WIT Press as well as John Sumesh from Exeter Premedia Services in India. I would also like to thank Wolfgang Zander, Professor at the Technical University of Berlin and Günther Walz from Siemens Power Generation in Germany for their input and help.

Last but not least, my most sincere thanks go to my wife Luda A. Liebe for her open-minded, steady, encouraging support, for her valuable improvements and for her patient appreciation.

Roland J. Liebe
Monheim a. Rh., Germany, 2006

Nomenclature

A	m^2	area, cross section
a, b, c	m	length (radius, wing span, chord)
C	–	dimensionless force coefficient $C = F/(Av^2\rho/2)$ (drag, lift, thrust)
C_D, C_L, C_T	–	drag, lift and thrust coefficients
E	$W s$	energy
E	N/m^2	Young's modulus, modulus of elasticity
F	N	force
F_L, F_D, F_T, F_W	N	lift, drag, thrust and weight force
f	Hz	frequency
Fr	–	Froude number
g	m/s^2	acceleration due to gravity
I	$kg m/s$	(translatory) momentum
K	–	reduced frequency = $v_\infty/(2 \text{ amplitude } \omega)$
L, l	m	length
M	$N m$	moment
M, m	$kg, kg/s$	mass, mass flow
Ma	–	Mach number
Nu	–	Nusselt number
p, p_s	bar	pressure, static pressure
P	W	power
R	m	radius
Re	–	Reynolds number = (velocity L/v)
s	m	distance, translation
Str	–	Strouhal number = $1/K = 2 \text{ amplitude } \omega/v_\infty$ (standard definition)
t	s	time
T	s	period of oscillation = $1/f = 2\pi/\omega$
u, v, w	m/s	velocity components, speed
W	N	weight force
x, y, z	m	Cartesian coordinates

r, φ, z	m	cylindrical coordinates
α, β, γ	rad	angle
δ	mm	thickness, boundary layer thickness
ε	–	strain, angle
ζ	–	coefficient of friction, profile quality = C_L/C_D
η	–	efficiency
ν	m^2/s	kinematic viscosity
ρ	kg/m^3	mass density
σ	N/m^2	normal stress
τ	N/m^2	shear stress
φ, Φ	rad	rotation, angle
χ, ψ	rad	phase difference, angle
ω	1/s	circular frequency of oscillation (rotation)
θ	kg m^2	polar moment of inertia

Volume 1: Flow Phenomena in Nature A Challenge to Engineering Design

Chapter 1 Introduction to fluid dynamics in nature and engineering	3
Concepts of aero- and hydromechanics.....	5
<i>M.F. Platzer & K.D. Jones</i>	
1 Historical overview	5
2 Potential flow concepts	10
3 Fundamentals of lift generation.....	12
4 Fundamentals of drag generation	15
5 Concluding remarks	18
Laws of similarity in fluid mechanics	20
<i>B. Weigand & V. Simon</i>	
1 Introduction	20
2 Dimensional analysis.....	21
3 Dimensional groups and their physical significance.....	25
4 Examples	28
4.1 The dynamics of planetary rings	28
4.2 The run-off from a watershed.....	30
4.3 The velocity of flight of birds.....	31
4.4 The resistance of a sphere in low Reynolds number flow	33
5 Conclusions	34
Evolution of flight in animals.....	36
<i>U.M. Lindhe Norberg</i>	
1 Introduction	36
2 Evolution of insect flight.....	37
3 Evolution of vertebrate flight	38

3.1	Up–down or down–up?	38
3.2	Probable steps in the evolution of bird flight	40
3.3	Evolution of pterosaur and bat flight.....	48
4	Conclusion.....	49
 Chapter 2 Swimming and flying in nature		55
Diversity, mechanics and performance of natural aquatic propulsors		57
<i>F.E. Fish</i>		
1	Introduction	57
2	Propulsive systems in aquatic animals	58
2.1	Anatomical-based swimming modes	59
2.2	Kinematics-based swimming modes	59
2.3	Force-based swimming modes	62
3	Energetics and efficiency	64
3.1	Propulsive efficiency	64
4	Energy conservation and flow	66
4.1	Schooling	66
4.2	Drafting.....	68
4.3	Porpoising.....	68
4.4	Burst-and-coast swimming.....	69
4.5	Wave-riding.....	70
4.6	Hitchhiking.....	71
4.7	Currents	71
4.8	Hydroplaning.....	71
4.9	Vorticity control	72
5	Application of biomimetics from aquatic animals	73
5.1	Convergence of design	74
5.2	Copying	74
5.3	Limitations of biomimetics.....	77
6	Conclusions	78
Flight of seeds, flying fish, squid, mammals, amphibians and reptiles.....		88
<i>A. Azuma</i>		
1	Flying seeds.....	88
1.1	Pappose seeds	88
1.2	Winged seeds	91
2	Flying fish and squid.....	94
2.1	Flight at a constant height.....	95
2.2	Unsteady flight path.....	96
3	Mammals, amphibians and reptiles.....	98
3.1	Flying squirrel.....	98
3.2	Other flying animals	98
3.3	Flying snake.....	100
4	Conclusion.....	101

Propulsion by sailing and sweeping	104
<i>A. Azuma</i>	
1 Various ways of locomotion using a wing for living creatures.....	104
1.1 Stationary wing.....	105
1.2 Rotary wing	106
1.3 Wheeling wing.....	106
1.4 Beating wing.....	106
1.5 Paddling wing.....	107
1.6 Fanning wing	107
1.7 Sweeping wing	108
1.8 Cyclo-gyro wing.....	108
2 Sailing	108
2.1 Mechanics of sailing.....	108
2.2 Sailing animals	110
3 Sweeping.....	113
3.1 Sweeping devices in animals.....	116
3.2 Crabs.....	116
4 Conclusion.....	117
Flight and scaling of flyers in nature.....	120
<i>U.M. Lindhe Norberg</i>	
1 Introduction	120
2 Dimensionless numbers that are important for flight dynamics	122
2.1 Lift and drag coefficients.....	122
2.2 Reynolds number.....	122
2.3 Strouhal number	122
3 Aerodynamic forces and power.....	123
3.1 Lift and thrust	123
3.2 Drag forces	125
3.3 Flight power.....	127
4 Gliding and soaring	128
5 Hovering.....	132
6 Energy-saving flight.....	135
6.1 Intermittent flight.....	135
6.2 Ground effect.....	136
6.3 Formation flight.....	136
7 Scaling of flight parameters	138
7.1 Wingspan and wing area.....	138
7.2 Wing loading and aspect ratio	138
7.3 Flight speed and power.....	139
7.4 Wingbeat frequency.....	141
7.5 Upper and lower size limits	142
8 Wing and tail design.....	142
8.1 Wing design.....	143
8.2 Tail form	145
8.3 How changes of shape and mass affect the power curve	146
8.4 Some lift-enhancing characteristics.....	146
9 Conclusions	147

Modelling the effects of unsteady flow phenomena on flapping flight dynamics—stability and control.....	155
<i>G.K. Taylor</i>	
1 Introduction: time history effects in flight dynamics	156
2 Flapping flight dynamics modelling	158
2.1 Autonomous versus non-autonomous unsteady aerodynamic inputs.....	158
2.2 Can autonomous unsteady aerodynamic inputs be neglected in flapping flight?	159
2.3 Time-periodic modelling of unsteady aerodynamic inputs in flapping flight	160
2.4 State–space modelling of unsteady aerodynamics	161
3 From flapping-flight dynamics models to flapping-flight control	162
3.1 Time-periodic feedback control systems	163
3.2 Sensing the aerodynamic state of the system	163
4 Conclusions	164
Chapter 3 Observation of steady and unsteady flow phenomena	167
2D steady/unsteady wings at low Re number flow	169
<i>A. Azuma</i>	
1 Introduction	169
2 Steady airfoils.....	171
2.1 Thin flat plate and effects of Re number	171
2.2 Effects of plate thickness	171
2.3 Effects of leading-edge configuration	172
2.4 Effects of camber.....	173
2.5 Surface waviness	175
2.6 Effects of airfoil thickness.....	175
2.7 Leading-edge sharpness.....	175
2.8 Effect of turbulence	176
2.9 Dragonfly wings	177
3 Unsteady airfoils	179
3.1 Heaving motion of a flat plate	182
3.2 Feathering motion of a flat plate.....	186
3.3 Combined heaving and feathering motions	186
3.4 Effects of profile configuration	186
4 Conclusion.....	190
Flow and force characteristics of steady 2D wing section at low Reynolds numbers	193
<i>K. Kawachi</i>	
1 Boundary layer	193
2 Calculation method	194
3 Wing section shape and lift-to-drag ratio.....	195
4 Flow pattern and aerodynamic force.....	196
5 Conclusion.....	197

Insect flight aerodynamics: structure of the leading edge vortex and selection pressures responsible for the use of high lift aerodynamic mechanisms in insects	198
<i>A.L.R. Thomas</i>	
1 Structure of the leading edge vortex	198
Application of the unsteady two-dimensional aerodynamic model to common dragonfly maneuvers	207
<i>P. Freymuth</i>	
1 Introduction	207
2 Mean pitch angle α_0 for dragonfly hovering	208
3 Escape mode	210
4 Sustained forward flight	210
5 Comparison of the helicopter model with the unsteady two-dimensional model	212
6 Estimation of the kinetic power of the jet moving in still air [actuator disk approximation in tandem with eqn (5)]—the minimum power required for a wing....	212
7 Visualization of vortex street formation by a hovering airfoil	213
8 Conclusions	217
Fanning in honey bees—a comparison between measurement and calculation of non-stationary aerodynamic forces	219
<i>M. Junge</i>	
1 Introduction	219
2 Results and interpretation of measurements carried out on fanning bees	220
2.1 Evaluating of the three-dimensional wing movement	220
2.2 The effective flow	222
2.3 The aerodynamic angle of attack	226
2.4 Measurement of air forces created during fanning	229
3 Simulation of flow on the wings using a ‘mechanical bee’	230
4 Simulation of the flow created during fanning and the calculation of the aerodynamic forces	230
4.1 The improved method of discrete vortices	231
5 Discussion: Role of the coefficients of circulation, vortices and inertia in the development of aerodynamic forces during fanning	239
6 Conclusion	240
Chapter 4 Understanding of force generation in fluids: physical modelling and the finite natural vortex—steady and unsteady flow simulation	245
Manifestation of the finite vortex—lift, thrust and drag	247
<i>W. Liebe & R. Liebe</i>	
1 Introduction	248
2 Ideal vortices	248
2.1 The closed vortex	248
2.2 The open vortex	249
2.3 The potential vortex	250
3 Real vortices	251

3.1	The natural vortex.....	252
4	The finite vortex concept.....	255
4.1	The edge vortex	255
4.2	The finite vortex model	257
4.3	The size of the finite vortex	261
5	Applications of the finite vortex model.....	262
5.1	Conservation of mass and momentum.....	262
5.2	Flow around fixed bodies	263
5.3	Flow around oscillating bodies.....	266
6	Swimming in nature	268
7	Flying in nature	272
8	Results and conclusions	276
	Unsteady flow mechanisms on airfoils: the extended finite vortex model with applications.....	283
	<i>R. Liebe</i>	
1	Introduction	284
2	Operating regimes in fluid dynamics	285
3	Flow around fixed bodies.....	288
3.1	The edge flow mechanism.....	289
3.2	Vortex formation	290
3.3	Flow around fixed cylinders and AFs.....	291
3.4	Vortex shedding from fixed cylinders.....	291
3.5	Accelerated edges.....	293
3.6	The trailing edge vortex and the bound vortex.....	295
4	Flow around oscillating bodies	297
4.1	Dynamic stall	297
4.2	Oscillating AFs.....	297
5	Vortex methods and the FVM.....	299
5.1	Finite vortex modeling.....	300

3	Applications in turbomachinery	491
4	Summary	497
	Flow separations in blood flow—its significance in the human circulation and in artificial organs	505
	<i>U. Kertzscher, L. Goubergrits & K. Affeld</i>	
1	Introduction—nature of flow separation	505
2	Flow separation in the human circulation system	510
2.1	Blood flow and separation in the circulation system of mammals	510
2.2	Problems in the human circulation system caused by separation	513
3	Conclusions	525
Chapter 6 Numerical methods for unsteady flow applications		
in engineering and nature		529
	Steady and unsteady aerodynamics	531
	<i>M.F. Platzer & K.D. Jones</i>	
1	Introduction	531
2	Steady low-speed airfoil flow at zero or moderate incidence angle	531
3	Low-speed airfoil flow near the stall angle	534
4	The Wagner effect	535
5	The Kramer effect	537
6	The Katzmayer effect	538

Oscillating hydro-wing as a propulsor in the quasi-steady domain	542
<i>P. Freymuth</i>	
1 Introduction	542
2 Analysis of oscillating wing performance in the quasi-steady domain.....	544
2.1 Thrust force T and side force S	544
2.2 Propulsive efficiency η and ideal efficiency η_{ideal}	544
2.3 Thrust and side force coefficients C_T and C_S	547
3 Sizing of propulsor for a given application	548
4 Acceleration of ship from rest to design speed U_0	548
5 Conclusions	549
Navier–Stokes computation of hovering dynamics.....	552
<i>K. Gustafson</i>	
1 Introduction and summary	552
2 Navier–Stokes computation of hovering dynamics	556
3 Vorticity in the far field.....	561
4 The direction of the hover-jet.....	564
5 Associated mathematical matters	565
6 Further remarks and outlook	568
Recent advances in unsteady boundary layer transition research	573
<i>M.T. Schobeiri</i>	
1 Introduction	573
2 Physics of an intermittent flow.....	574
2.1 Identification of intermittent behavior of statistically steady flows	575
2.2 Turbulent/non-turbulent decisions.....	576
2.3 Identification of intermittent behavior of a periodic unsteady flow	578
2.4 Implementation of intermittency function into Navier–Stokes equations.....	578
3 Modeling the unsteady intermittency for turbomachinery applications.....	584
3.1 Experimental investigations	584
4 Unsteady intermittency analysis.....	588
5 Implementation of the transition model into calculation procedures.....	592
6 Aerodynamic and heat transfer studies	593
6.1 Curved plate: experimental results, turbulence intermittency distribution.....	593
6.2 Unsteady turbine cascade experiments.....	596
7 Conclusions	601
An indicial-Polhamus aerodynamic model of insect-like flapping wings in hover	606
<i>C.B. Pedersen & R. Żbikowski</i>	
1 Introduction	606
1.1 Wing kinematics	607
1.2 Main aerodynamic phenomena in insect flight.....	608
2 Model overview and relevant prior work.....	610
2.1 Model structure and assumptions	610
2.2 Relevant prior work	611
3 Quasi-steady effects	611
3.1 Potential theory.....	612
3.2 Dirichlet solution	612

3.3	Kutta–Joukowski condition	613
3.4	Unsteady form of Bernoulli equation	613
3.5	Leading edge suction correction	614
3.6	Quasi-steady forces	614
3.7	Total quasi-steady force	615
3.8	Wing integrals	616
3.9	Moments	617
3.10	Wing moment integrals	618
4	Added mass effects	619
4.1	What is added mass?	619
4.2	Potential form of added mass	619
4.3	Total circulation	620
4.4	Accelerations	621
4.5	Normal added mass forces	621
4.6	Parallel added mass forces	622
4.7	Vertical and horizontal added mass forces	623
4.8	Moments	623
4.9	Comparison with standard results	624
4.10	Wing integrals	625
5	Polhamus leading edge and tip suction correction	626
5.1	Polhamus’s analogy	626
5.2	Correction for leading edge sweep	626
5.3	Implementation	626
5.4	Forces	628
5.5	Wing integral	628
6	Wake effects	629
6.1	Potential form of wake model	629
6.2	Wagner’s model	629
6.3	Küssner’s model	630
6.4	Loewy’s model	631
6.5	Modified Loewy model	632
6.6	Combined wake model	632
6.7	Added mass and the wake	634
6.8	Polhamus correction and the wake	634
7	Code implementation	635
8	Dickinson’s Robofly data	636
8.1	Geometry	636
8.2	Kinematics	636
9	Indicial-Polhamus model prediction for Robofly data	637
9.1	The ‘lift’ force, F_V	637
9.2	The ‘drag’ force	645
10	Discussion	649
10.1	Discussion of results	649
10.2	Evaluation of results	651
11	Conclusions	653
11.1	Assumptions	653
11.2	Theory conclusions	654
	Appendix A: Terminology and notation	654
A.1	Angle of attack	654

A.2	Velocities	655
A.3	Forces.....	656
A.4	Moments	660
A.5	Other definitions	661
A.6	Basic identities.....	661

**Chapter 7 Experimental methods for unsteady flow applications
in engineering and nature 667**

Modern image-based experimental methods for application in fluid dynamics 669

J. Kompenhans

1	Introduction	669
2	Image-based experimental methods.....	670
2.1	Set-up of non-standard video techniques for qualitative and quantitative flow visualization	672
2.2	Particle image velocimetry	680
2.3	Pressure sensitive paint.....	685
2.4	Density measurement techniques	688
2.5	Position and deformation measurement techniques	690
3	Conclusions	695

Unsteady airfoil experiments..... 698

M.F. Platzer & K.D. Jones

1	Introduction	698
2	Dynamic airfoil stall.....	698
3	Experimental studies of the Katzmayr effect.....	699
4	Flapping-wing propulsion	701
5	Flapping-wing aerodynamics in hover.....	704

Vortex wakes of bird flight: old theory, new data and future prospects 706

A. Hedenström

1	Introduction	706
2	Some definitions.....	707
3	Vortex theories of bird flight.....	708
3.1	The actuator disc and momentum jet.....	708
3.2	Vortex ring theory	708
3.3	The constant circulation wake and other relatives.....	710
4	Bird wakes in reality	712
4.1	Take-off flight.....	712
4.2	Slow forward flight.....	712
4.3	Cruising flight.....	714
4.4	Gliding flight	714
4.5	Conclusion and speculation	714
5	Bird wakes in reality: digital particle image velocimetry (DPIV)	715
5.1	The wind tunnel	715
5.2	DPIV for birds (BPIV)	715

5.3	DPIV of a thrush nightingale.....	716
5.4	DPIV of a robin.....	721
5.5	Wakes and kinematics.....	724
5.6	Comparing wake properties.....	725
6	Discussion.....	726
6.1	The topology of the wake and its properties.....	727
6.2	Optimum kinematics.....	728
6.3	Aerodynamic mechanisms.....	728
6.4	A vortex wake theory.....	728
6.5	The ecology and evolution of flight.....	730
6.6	Future prospects.....	730
Shedding light on animal-generated flows: quantitative analysis of animal-generated flow patterns using DPIV.....		735
<i>E.J. Stamhuis</i>		
1	Introduction.....	735
2	DPIV set-up for recording biogenic flows.....	736
2.1	Choice of medium and flow conditions.....	735
2.2	Particle seeding.....	738
2.3	Illumination.....	739
2.4	Camera and storage system.....	740
2.5	DPIV analysis.....	741
2.6	Data validation and presentation.....	741
2.7	Interpretation.....	743
3	Conclusion.....	744
Temperature and pressure sensitive coatings.....		747
<i>J. von Wolfersdorf, P. Ott & B. Weigand</i>		
1	Introduction.....	747
2	Thermochromic Liquid Crystals (TLCs).....	748
2.1	Liquid crystal thermography.....	749
2.2	Calibration.....	751
2.3	Heat transfer measurement techniques.....	753
3	Pressure Sensitive Paints (PSPs).....	755
3.1	Photoluminescence.....	756
3.2	Measurement concept.....	756
3.3	Calibration.....	758
3.4	Pressure measurements.....	759
3.5	Concentration measurements for film-cooling applications.....	761
