International Series on Advances in Fluid Mechanics

Objectives

The field of fluid mechanics is rich in exceptional researchers worldwide who have advanced the science and brought a greater technical understanding of the subject to their institutions, colleagues and students.

This book series has been established to bring such advances to the attention of the broad international community. Its aims are achieved by contributions to volumes from leading researchers by invitation only. This is backed by an illustrious Editorial Board who represent much of the active research in fluid mechanics worldwide.

Volumes in the series cover areas of current interest or active research and will include contributions by leaders in the field.

Topics for the series include: Bio-Fluid Mechanics, Biophysics and Chemical Physics, Boundary Element Methods for Fluids, Experimental & Theoretical Fluid Mechanics, Fluids with Solids in Suspension, Fluid-Structure Interaction, Geophysics, Groundwater Flow, Heat and Mass Transfer, Hydrodynamics, Hydronautics, Magnetohydrodynamics, Marine Engineering, Material Sciences, Meteorology, Ocean Engineering, Physical Oceanography, Potential Flow of Fluids, River and Lakes Hydrodynamics, Slow Viscous Fluids, Stratified Fluids, High Performance Computing in Fluid Mechanics, Tidal Dynamics, Viscous Fluids, and Wave Propagation and Scattering.

Preface

The flow of blood in arteries, the flow of refrigerant in an air conditioner, the injection of fuel in an internal combustion engine and the sequestration of supercritical carbon dioxide in saline aquifers, are a small set of examples that illustrate the pervasiveness of multiphase flows in natural and man-made processes. The ability to predict multiphase flows is of great benefit in process design, or in the diagnosis and correction of problems in an established process.

Although enormous strides have been made in the understanding, modeling and numerical simulation of multiphase flows, it is clear that much remains to be done. The principal difficulty that one has in modeling multiphase flow is that in general several length scales, with coupling in one or both directions, play a part in the overall behavior of the flow. Because of the wide range of length scales, it is very difficult to treat such systems solely by employing massive computer resources. On the other hand, continuum constitutive models are more efficient, but they seldom describe all the physics that are taking place in a rigorous way. The link between the different scales remains elusive.

As an example, consider the processing of a familiar emulsion, mayonnaise. In decreasing order of magnitude, the relevant length scales are the size of the container, the size of the droplets in the emulsion, the separation between droplets, the molecular size of the constituents. In addition, drops may break or coalesce as a function of the surface tension and the stress state. The difficulty of modeling such a system in its entirety is enormous. Other systems may be further complicated by chemical reactions, diffusion and turbulence.

It is not likely that an all-encompassing theory will be found which can account for the multitude of complex interacting phenomena found even in the simplest systems, or that computers powerful enough to perform a full ab initio simulation will solve the problem. What is more probable is that one or more particular techniques are matched to a system or a phenomenon of interest, which is able to capture the essential physics under a range of conditions. This book which comprises most of the papers presented at the 2nd International Conference on Multiphase Flow held in Sante Fe, New Mexico, aims to facilitate this process, that is, to expose researchers and practitioners in the field to new techniques, new problems, new paradigms, resulting in the generation of new ideas.

The breadth of topics covered in this book is evident from the table of contents. The editors are grateful to the scientific advisory committee for their invaluable help especially in attracting many excellent contributions. We hope and trust that their efforts will result in new ideas, collaborations and to the advancement of this important branch of scientific knowledge in general.

The Editors
Sante Fe, 2003

CONTENTS

Section 1: Multiphase flow systems

Boundary element method numerical model based on mixture theory of two-phase flow <i>M. Požarnik & L. Škerget</i>	3
Front tracking for multiphase fluid mixing <i>J. Glimm, H. Jin & Y. Zhang</i>	13
A finite-volume based computational model for one dimensional, unsteady two fluid flow in a pipe <i>E.R. Seo, D.-D. Lee & S. Parameswaran</i>	23
A mathematical model of particle transport in electrostatic spray coating <i>S.A. Colbert & R.A. Cairncross</i>	33
Numerical analysis of powder deposition in blast furnace by using multi-fluid process simulator <i>S. Pintowantoro, H. Nogami & J. Yagi</i>	43
Large-eddy simulation of multiphase flows in complex combustors <i>S.V. Apte, K. Mahesh, F. Ham, G. Constantinescu & P. Moin</i>	53
Numerical modelling of liquid-liquid flow related to countercurrent chromatography (CCC) <i>C.S. König & I.A. Sutherland</i>	63
Spreading of a viscous liquid film over the corrugated surface <i>Y. Trifonov</i>	75
Dispersion and coalescence of two pulses of spherical solid particles dropped successively into an initially quiescent liquid <i>J.W. Holbeach & M.R. Davidson</i>	85

Simulation of particle-laden gas flows in an anti-abrasive elbow <i>Y.J. Kim & H.-S. Kim</i>	95
Spectrum of acoustic noise excited by collapse of spherical bubble in viscoelastic liquid <i>L. Likhterov</i>	105
Numerical modeling of formation and movement of vortex rings using a shock tube <i>A. Rychkov & H. Miloshevich</i>	117
Section 2: Multiphase flow and heat transfer	
Numerical simulating for three kinds of phase-change heat transfer problem in two-phase flow <i>W.-Q. Lu, F. Bai, Q. Fan, W. Guo & L. Han</i>	127
Experimental and numerical investigations in the near-burner region of a versatile multi fuel burner <i>K. Orfanoudakis, A. HatziaPOSTOLOU, E. Mastorakos, K. Sardi, K. Krallis & N. Vlachakis</i>	137
Section 3: Particle-flow interaction	
Simulation of settling and break-up of suspension drops in a fluid <i>T. Bosse, C. Härtel, E. Meiburg & L. Kleiser</i>	149
Vortex method for Lagrangian-Lagrangian simulation applied to internal liquid-solid two-phase flow <i>Y. Iso & K. Kamemoto</i>	159
Transport phenomenon of two-dimensional circular particle moving in axially rotating drum filled with viscous fluid <i>S. Torii, S. Tanaka, T. Yano & Y. Watanabe</i>	169
DNS study of interactions between clouds of particle and isotropic homogeneous turbulent flow <i>T. Tsuji, H. Kanda, T. Yokomine & A. Shimizu</i>	179
Interaction of flow with mobile bottom in the river mouth <i>R. Khanbilvardi, B. Shteinman, V. Khazin & O. Ozkurt</i>	189
Modelling and simulation of gas-solid flows in riser reactors <i>S.A. Coutinho, J.J.N. Alves, W.P. Martignoni & M. Mori</i>	199

Section 4: Suspensions: experiment and theory

Direct evaluation of lubrication forces in asymptotically corrected completed double layer boundary integral equation formulations
A.A. Mammoli 211

Dynamics of particle suspensions in heterodyned triaxial magnetic fields
J.E. Martin, R.A. Anderson & R. Williamson 221

MRI studies of sedimenting suspensions
S.A. Altobelli & S.D. Beyea 231

Section 5: Continuum suspension models

Particle migration rates in a Couette apparatus
S.-C. Hsiao, D. Christensen, M.S. Ingber, L.A. Mondy & S.A. Altobelli 241

An ellipsoidal droplet model for dilute emulsions: application to complex mixing flows
C.L. Tucker III, C.A. Florek & T. Pham 253

Development of a frame-invariant suspension flow model
R.M. Miller & J.F. Morris 263

One-dimensional analysis of a continuum model for structure in electrorheological fluids
K. von Pfeil, M.D. Graham, D.J. Klingenberg & J.F. Morris 275

Section 6: Interface phenomena

Approximation of multicomponent fluid flows with a varying coefficient of interfacial tension
W.W. Miles 289

The role of solid substrate on the spreading kinetics of liquid droplet
A.M. Alteraifi & B.J. Sasa 299

Section 7: Bubble and drop dynamics

A hybrid Eulerian-Lagrangian method for LES of atomizing spray
F. Ham, Y.-N. Young, S. Apte & M. Herrmann 313

Model of the smoothed motion of interacting particles in LES of turbulent dispersed two-phase channel flow
M. Gorokhovski & A. Chtab 323

2-D droplet deformation and breakup with Lattice Boltzmann model <i>R.G.M. van der Sman, S. van der Graaf & A.J. Gijsbertsen-Abrahamse</i>	333
Numerical simulation of air bubbles rising in water using an axisymmetric VOF method <i>J. Dai, J.D. Sterling & A. Nadim</i>	343
Head-on collision of two equal-sized drops with van der Waals forces <i>X. Jiang & A.J. James</i>	353
Numerical simulation of bubble entrance to a capillary needle <i>X. Chen & H.N. Ögüz</i>	363
Section 8: Bubble flows	
CFD modeling of bubbly flow in a slug unit cell <i>H. Laux & R. Schulkes</i>	379
CFD simulations of a bubbly flow experiment with liquid eutectic alloy PbBi and Nitrogen <i>G. Mercurio & S. Eckert</i>	395
Section 9: Cavitation	
Cavitation and the development of static and dynamic tensions in doubly metastable liquids <i>D. Rogers, P.R. Williams, R.L. Williams, P.M. Williams, M.S. Barrow & A. Al-Hussany</i>	407
Cavitation of multigrade oils under dynamic stressing at elevated temperatures <i>P.R. Williams & R.L. Williams</i>	415
An interface interaction method for compressible multiphase flows <i>X.Y. Hu & B.C. Khoo</i>	429
Index of authors	439
