Preface

This book contains the edited papers of the First International Conference on Harmonisation between Architecture and Nature (ECO-ARCHITECTURE 2006), which took place at the Wessex Institute of Technology Campus in the New Forest, UK.

Unlike the mechanistic buildings it replaces, Eco-Architecture is in harmony with nature, including its immediate environs. Decisions have to be taken on ecological grounds concerning locations, siting and orientation, as well as the well-informed choice of materials.

Eco-Architecture makes every effort to minimise the use of energy at each stage of the building’s life cycle, including that embodied in the extraction and transportation of materials, their fabrication, their assembly into the building and ultimately the ease and value of their recycling when the building’s life is over. The design may also take into consideration the use of energy in building maintenance and changes in its use, not to mention its lighting, heating and cooling, particularly where the energy consumed involves the emission of greenhouse gases.

Substantial savings can be achieved by passive energy systems, especially natural ventilation, summer shading and winter solar heat gain. Solar energy may be used in panel pipes for heating water and photovoltaic cells.

The development of Eco-Architecture is driven by the depletion of natural resources, especially fossil fuels and the need to preserve the balance of nature. The extensive use of steel and glass and the built-in problems of discomfort from solar over-heating and winter heat loss, has led to the widespread use of mechanical systems. Eco-Architecture is providing instead imaginative and expressive solutions driven by a generation of highly creative designs. It has important cultural as well as architectural impacts.

Eco-Architecture is by definition inter-disciplinary; it requires the collaboration of engineers, planners, physicists, sociologists, economists, and other specialists, in addition to architects. The papers contained in this book were written by different specialists and attempt to focus on the interdisciplinary character of eco-architecture.

The editors are grateful to all the authors for the quality of their papers and to the members of the International Scientific Advisory Committee as well as other colleagues who helped to review the papers.

The Editors,
The New Forest
2006
Contents

Section 1: Ecological and cultural sensitivity

Cultural responses to primitive needs
N. Baker ................................................................................................................3

Ecological propriety and architecture
V. A. Metallinou ..................................................................................................15

Architecture and nature at the end of the 20th century: towards a dialogical approach for sustainable design in architecture
F. J. Soria López ....................................................................................................23

The keyword is quality not ecology
A. van Hal ...........................................................................................................35

In-between architecture and landscape, from theory to practice
B. Ott ..................................................................................................................45

Ecological, modular and affordable housing
J. Quale .............................................................................................................53

Flexi-Living: adaptable property, adaptable housing, transforming lives
I. MacBurnie ......................................................................................................63

The study of restoring an eco-habitat of the traditional Paiwan tribe in Taiwan
C.-J. Chen ..........................................................................................................73

Urban planning and the quality of life in Putrajaya, Malaysia
D. Bt Omar ......................................................................................................83
Section 2: Historical and philosophical aspects

Evaluating the sophistication of vernacular architecture to adjust to the climate
E. Tsianaka..........................................................................................................93

Examining line as a heuristic device in the design ethos of Alvar Aalto
P. Harwood.......................................................................................................103

Historical influences of wind and water in selecting settlement sites
P. Kilby.............................................................................................................115

Unity, simplicity and balance: sustainable management of cultural historic environments of mountain summer farming
G. Swensen........................................................................................................123

A tale of two city halls: icons for sustainability in London and Seattle
D. Armpriest & B. Haglund ..............................................................................133

Poetic water images in architecture
U. Kirschner.....................................................................................................143

Section 3: Design with nature

The 2005 Solar D house
M. Garrison....................................................................................................155

Fractal geometry and architecture: some interesting connections
N. Sala.............................................................................................................163

Symbols, metaphors, analogues: seeding, modelling and achieving sustainable design
R. J. Koester....................................................................................................175

A methodology for sustainable design analysis of large scale buildings
R. Richarde & R. Ibrahim................................................................................185

Developing designs in balance with nature
A. J. Anselm....................................................................................................195

Outdoor residential landscape design in an arid natural conservation area: Bahía de Los Ángeles, México
R. Rojas-Caldelas, G. Bojórquez-Morales, A. Luna-León, E. Corona-Zambrano & J. Ochoa-Corrales .....................................................205
The house by the lake
C. A. Brebbia & J. Gorst.................................................................215

Indicators for the ecological planning of buildings
C. Seyler, C. Stoy, I. Lützelschwab & S. Kytzia...............................227

Sustainable building design in Australia
C. McCabe ..........................................................................................237

Design and construction: changing the role
P. Rossi .....................................................................................................247

Section 4: Assessment and selection of materials

Natural materiality – the people’s choice
F. Stevenson ............................................................................................257

Environmental impact of materials used in technical equipments:
an overview on different methods
L. Marletta, G. Evola & F. Sicurella .......................................................267

Designing for longevity
V. Straka..................................................................................................277

Natural building systems: experiments in urban ecology
K. Connors .............................................................................................287

Promoting sustainability of earth constructed private and
public buildings in South Africa
G. Bosman ..............................................................................................297

Section 5: Natural technologies

Heteronomy and (un)sustainability of essential technical infrastructures
A. van Timmeren ...................................................................................309

Eco-design of technological systems in buildings
L. Marletta, G. Evola & F. Sicurella .........................................................319

Section 6: Design by passive systems

Sound barriers to enable open windows and integration in landscape
G. Rosenhouse .........................................................................................331
Practicing what we preach
*M. Lawton* ........................................................................................................341

Guidelines for sizing roof windows
*S. Robertson & M. Thompson* ...........................................................................351

**Section 7: Building operation and maintenance**

Building defects: survey and impact over sustainability
*E. Costanzo* ........................................................................................................361

Cob seismic rehabilitation
*G. Scudo & A. Drei* ...........................................................................................369

**Section 8: Water conservation**

Rainwater harvesting in Brazil: investigating the viability of
rainwater harvesting for a household in Brasilia
*D. Sant’Ana* ........................................................................................................381

Reliability of rainwater harvesting
*J. W. Male & M. S. Kennedy* ..............................................................................391

User experiences with decentralised water systems in an
ecological residential area
*A. A. E. Luising* ..................................................................................................401

**Author index** ...................................................................................................409
