Preface

This book contains the papers presented at the Fifth International Conference on Computer Simulations in Biomedicine (Biomedicine 2003) held at the University Medical Centre of Ljubljana in Slovenia in April 2003. The conference was organised jointly by the University Medical Centre Ljubljana, the Faculty of Computer and Information Science, University of Ljubljana, and the Wessex Institute of Technology, Southampton, UK.

Computer models have been increasingly successful in simulating biological phenomena. The advantages of this approach are numerous, particularly in the area of biomedicine where it has led to a better understanding of the mechanics of physiological processes. The use of computational models has also spread to many applications in medicine, as demonstrated by the contents of this book. Another major contribution brought to the medical community by the wide availability of computational facilities and the development of numerical techniques, is the ability to acquire, analyse, manage and visualize massive amounts of data.

Current medical and biological technology has advanced very rapidly in recent years. As these advances continue, enormous progress in health care and the consequent improvements in people’s lives will be available in the very near future. It can be expected that a number of illnesses and diseases as well as age-old handicaps will benefit from the development of computational biomedicine. This progress is related to the application of computational fluid dynamics, computer vision, better artificial limbs and prostheses, neural implants, biosensors, tissue engineering, artificial organs and others. Computers are also providing virtual environments, minimising surgical procedures, developing intelligent environments for the disabled, better telemedicine communications, etc.

The papers included in the book cover a broad spectrum of topics on the application of computers to simulate biological phenomena. They nevertheless represent a small portion of the efforts which are leading to a much better future for mankind.

There are now two challenges faced by medical professionals and biomedical engineers. Firstly, the challenge of using state-of-the-art computer technology and secondly, working with living systems. In an attempt to bring the contents of this book closer to the medical professionals, we arranged the papers in sections according to their medical and biological perspective. The book is divided into eleven sections covering:
Simulation of Physiological Processes; Cardiovascular System (Vascular System, Lung, Cardiac System & Applications); Artificial Limbs & Joints (Orthopaedics & Biomechanics); Electrical Stimulation (Functional Electrical Simulation & Cellular Engineering); Data Acquisition & Computer Vision: Analysis & Diagnostics; Applications of Artificial Intelligence in Medicine; Virtual & Intelligent Environments.

The Editors are grateful to all the authors for their excellent contributions and in particular to the members of the International and Local Scientific Advisory Committees for their help. They hope that this volume will increase the awareness of the potential of computer simulations amongst medical professionals, engineers and scientists working in this exciting new field.

**The Editors**
April 2003
CONTENTS

Section 1: Simulation of physiological processes

On the variation of parameters that characterize the state of a physiological system. Red blood cells as an example
S. Svetina, M. Brumen, M. Gros, S. Vrhovec & T. Žnidarčič........................................ 3

The cardiac cell model at normal and high pacing rates with Markovian representations of gating processes
(Computer simulation study)
B. Kogan, J. Better & I. Zlochisty................................................................. 15

On coupling cellular automata based activation and finite element muscle model applied to heart ventricle modelling

Comparison of different models of orientation selectivity in primary visual cortex
G.E. La Cara & M. Ursino ............................................................................... 35

Brain cooling strategies: numerical simulations on a realistic human head geometry
B. Dennis, R. Eberhart, G. Dulikravich & S. Radons ....................................... 45

Section 2: Cardiovascular system: vascular system

Stochastic nonlinear dynamics of the cardiovascular system
P.V.E. McClintock & A Stefanovska............................................................... 57

A heterogeneous approach for modelling blood flow in an arterial segment
A. DiCarlo, P. Nardinochi, G. Pontrelli & L. Teresi ....................................... 69

MRI based CFD analysis for brain blood flow with IDO-AMR method
T. Aoki, Y. Imai, T. Kobara & H. Ikehira ....................................................... 79

Cavitation phenomena in thin films of Newtonian and non-Newtonian fluids due to rapid bubble expansion
P.R. Williams, R.L. Williams & A. Al-Hussany ........................................... 89
Metabolic system dynamics: lumped and distributed models  
G. M. Saidel, J.A. DiBella II & M. E. Cabrera .................................................. 101

Advanced cardiovascular physiology studied by applying the equivalent electronic circuit  
M. Jelenc, T. Podnar, F. Runovč & M. Kordaš .................................................. 111

Section 3: Cardiovascular system: lung

Eulerian multiphase CFD analysis of particle transport and deposition in the human lung  
R.F. Kunz, D.C. Haworth, L.S. Leemhuis, A.C. Davison, S. Zidowitz & A. Kriete ................................................................. 121

A geometric model analysis of conductive airways in expiratory flow limitation during artificial ventilation  
G. Cevenini, F. Bernardi, M.R. Massai & P. Barbini ............................................. 135

Estimation of respiratory parameters during mechanical ventilation: a simple method taking account of tubing compliance  
C. Brighenti, G. Gnudi & S. Severi ................................................................. 145

Fundamentals of alveolar diffusion: impact of microscopic solid particles  
V. Kulish .......................................................................................................... 155

Section 4: Cardiovascular system: cardiac system

Feasibility study of the dynamic mesh model in FLUENT for fluid-structure interaction of a heart valve  
K. Dumont, J. Vierendeels & P.R. Verdonck .................................................. 169

The itramyocardial stress and the mechanics of the left ventricular contraction  
R.M. Shoucri .................................................................................................. 177

Computational haemodynamics of left coronary artery  

A modelling study of the cardiovascular response to exercise in patients with mitral stenosis  
E. Magosso & M. Ursino ................................................................. 199

Index for cardiac dysfunction of left-ventricular filling phase  
L. Zhong, D.N. Ghista & E.Y-K. Ng ................................................................. 209

Equivalent electronic circuit model of cardiovascular system  
M. Jelenc, M. Kordaš & F. Runovč ................................................................. 219
Section 5: Cardiovascular system: applications

Analytical estimation of flow-induced forces in endovascular grafts and design methodology for a tissue-engineered endovascular attachment mechanism
E.A. Finol, K.G. Marra & C.H. Amon .............................................................. 231

Numerical modelling of the haemodynamics of a left ventricular assist device (LVAD) prototype
F. Lagasco, M. Castelanelli, G. Vezzani & M. Ercolani .................................... 243

Experimental study of hydrodynamics in PTFE-grafts
I. Van Tricht, D. De Wachter, J. H. M. Tordoir & P. Verdonck .......................... 253

Application of PIV and PTV techniques to study propensity for thrombogenesis in PHV
M. Grigioni, C. Daniele, A. Balducci, G. D’Avenio, G. Querzoli,
G. P. Romano & V. Barbaro ............................................................................ 261

Critical aspects for a CFD simulation compared with PIV analysis of the flow field downstream of a prosthetic heart valve
M. Grigioni, C. Daniele, C. Del Gaudio, A. Balducci,
U. Morbiducci, G. D’Avenio & V. Barbaro ...................................................... 271

Section 6: Artificial limbs & joints: orthopaedics & biomechanics

Artificial upper limb development, simulation and control
F. Casolo, M. Camposaragna & M. Molaschi .................................................. 283

Numerical pre-clinical testing in hard tissue surgery
J. Vander Sloten, H. Van Oosterwyck, V. Pattijn & T. Van Cleynenbreugel .... 295

The application of holography laser for the assessment of bone-implant fixation conditions
J. A. Simões & M. Vaz ...................................................................................... 305

Bone remodelling considering drug effects on a damage mechanics model
M. E. Zeman, J. M. Garcia, M. Cerrolaza & M. Doblaré ................................ 315

The effect of cemented femoral stem cross-section geometry in total hip replacement
A. Ramos, F. Fonseca & J. A. Simões ................................................................ 323

Shape optimization of a cementless hip stem
P. R. Fernandes & R. B. Ruben ........................................................................ 333

FEM simulation of soft tissues
Z. Zhou & D. M. Bruce .................................................................................... 343
Section 7: Electrical stimulation: functional electrical stimulation

Simulation model of robot supported standing-up in paraplegia
R. Kamnick, J. Kuželički & T. Bajd ................................................................. 355

Development of the swing phase relearning device
I. Cikajlo, Z. Matjačič & T. Bajd .................................................................. 365

Anorectal sphincter muscle stimulator design
S. Kara & M. Okandan .................................................................................. 375

Section 8: Electrical stimulation: cellular engineering

Algorithm for synchronization of electroporation pulse delivery with electrocardiogram
B. Music, T. Jarm, F. Jager & D. Miklavčič ................................................... 381

Increased pulse repetition frequency for effective and less painful electrochemotherapy

Study of flow characteristics and viscoelastic parameters of tumor cells in cancer growth
V. K. Katiyar & K. S. Basavarajappa ............................................................... 401

Section 9: Data acquisition & computer vision: analysis and diagnostics

Detection of ductus in mammary gland tissue by computer vision
K. Mele & A. Leonardis .................................................................................. 411

On the applicability of electrical impedance indices to characterize the condition of the oral mucosa
I. Lackovič, Z. Stare & T. Protulipac ............................................................... 421

Section 10: Applications of artificial intelligence in medicine

Subgroup discovery: On-line data mining server and its application
D. Gamberger, T. Šmuc & N. Lavrač .............................................................. 433

Advanced parameter optimization in EPR spectroscopy
B. Filipič & J. Štancar ................................................................................... 443

Diagnosis of heart valve stenosis through the use of artificial neural networks
S. Kara, A. Güven, M. Okandan & F. Dirgenali ............................................ 453
Modeling the cerebral activity with dynamic probabilistic networks
V. Labatut & J. Pastor...................................................................................... 459

A comparison of two alternative methodologies for estimation of length of hospital stay
A.E. Smith, V. Stankovski & D.M.Marsh.......................................................... 469

Section 11: Virtual & intelligent environments

Multilevel implementation of the dynamic virtual environment
D. Korošec, A. Holobar, M. Divjak & D Zazula............................................. 477

Improved home care activities for brain-injured children:
the creation of a wireless platform
A. Tura, L. Quarenì, D. Longo & M. Badanai............................................. 487

The role of intelligent habitats in upholding elders in residence
H. Pigot, B Lefebvre, J. Meunier, B.Kerhervé, A. Mayers & S. Giroux .......... 497

The intelligent habitat and everyday life activity support
H. Pigot, A. Mayers & S.Giroux....................................................................... 507

Simulation of intravenous pumps’ operation
S. Kara, F. Şener, S. Kemaloğlu & M. Okandan ............................................ 517

Author Index .................................................................................................. 523
